 - My Personal Perspective
 - Conclusion

Proof of Participation

I attended the **Week 2 session** of the Alkhidmat Summer Internship Program 2026 in **online mode** through the official YouTube live session. During the session, I actively followed the discussions and learned about personality development, mental well-being, productivity, career readiness, and personal branding. The screenshot below serves as proof of my participation in the online session.

Proof of Participation:

Assignment 1 – Understanding Yourself

MBTI Personality Test Result

Personality Type: INFJ-A (Advocate)

Reflection

1. My Personality Type

After taking the MBTI Personality Test, I discovered that my personality type is **INFJ-A (Advocate)**. According to the results, INFJs are thoughtful, empathetic, creative, and purpose-driven individuals who enjoy helping others and making a positive impact on society. I found many parts of the report relatable, especially the emphasis on meaningful work,

understanding people's emotions, and continuously improving myself. As a Software Engineering student and an intern at Alkhidmat Foundation, I believe these qualities will help me work effectively with people and contribute positively to the community.

2. Three Strengths

The first strength I identified is **empathy**. I try to understand other people's feelings and perspectives before making decisions, which helps me build respectful and positive relationships.

The second strength is **creative problem-solving**. I enjoy analyzing situations from different angles and finding practical solutions. This ability is especially useful in my academic projects and technical work.

The third strength is **dedication and responsibility**. Once I commit to a task, I make every effort to complete it on time and to the best of my ability. I like staying organized and giving my full attention to my responsibilities.

3. Two Areas for Improvement

One area I would like to improve is **handling criticism more positively**. Sometimes I take feedback personally instead of viewing it as an opportunity to learn and grow. I want to become more confident and use constructive criticism to improve my skills.

Another area for improvement is **delegating work**. I often prefer completing tasks on my own because I want everything to meet my expectations. However, I understand that teamwork and trusting others are important skills in both academic and professional environments.

4. How Understanding Myself Will Support My Personal and Professional Growth

Understanding my personality type has given me a better understanding of my strengths and the areas where I need to improve. It has helped me recognize how I communicate, solve problems, and interact with others. I believe this self-awareness will help me become a better student, teammate, and future software engineer.

It will also support my professional growth by improving my communication, teamwork, leadership, and decision-making skills. As an Alkhidmat intern, I hope to use these qualities to work effectively with others, contribute to community service projects, and continue developing both personally and professionally. Learning more about myself has motivated me to keep improving and make a positive impact wherever I work.

Assignment 2 – Mental Well-being & Productivity

2-Day Digital Detox Challenge

Digital Detox Activities Completed

- No phone during meals
 - No phone for 30 minutes after waking up
 - Turned off unnecessary notifications
 - Kept my phone away during study/work most of the time
 - Read 10 pages of a book daily
 - Avoided using my phone one hour before sleeping on most occasions
-

Reflection

Participating in the 2-Day Digital Detox Challenge was a valuable experience for me. Although I completed most of the tasks, I realized how much time I normally spend using my phone without even noticing it. Reducing my screen time helped me become more aware of my daily habits and encouraged me to use my time more wisely.

One of the biggest changes I noticed was an improvement in my productivity. Keeping my phone away while studying helped me stay focused for longer periods and reduced unnecessary distractions. Turning off unnecessary notifications also made it easier to concentrate on my work without constantly checking my phone. Reading 10 pages of a book each day was another positive habit that helped me relax while also learning something new.

The challenge also had a positive impact on my thinking and mental well-being. Spending less time on social media reduced information overload and allowed me to feel calmer throughout the day. Although it was sometimes difficult to avoid checking my phone out of habit, I gradually became more mindful of how often I reached for it. This experience reminded me that maintaining a healthy balance between technology and daily life is important for both mental health and productivity.

The mindfulness activity that benefited me the most was **going to the gym**. Exercising helped me clear my mind, reduce stress, and feel more energetic. After each workout, I felt refreshed, more focused, and motivated to complete my daily tasks. It also improved my mood and gave me a positive mindset throughout the day.

Overall, this challenge taught me that small changes in daily habits can make a big difference. By reducing unnecessary phone usage and focusing more on productive activities, I was able to improve my concentration, manage my time better, and maintain a healthier routine. I plan to continue practicing these habits because they will help me in my academic life, future career, and personal well-being.

Assignment 3 – AI & Digital Footprints on Employment

AI & Digital Footprints on Employment

Introduction

Technology has changed the way people study, communicate, and find jobs. Today, Artificial Intelligence (AI) is playing an important role in recruitment, while our digital footprint has become a significant factor in shaping our professional image. Employers no longer evaluate candidates only through resumes and interviews. They also review online profiles, portfolios, and social media activity to better understand a candidate's skills, personality, and professionalism. Therefore, understanding AI and maintaining a positive digital footprint have become essential for career success.

What is Artificial Intelligence in Employment?

Artificial Intelligence refers to computer systems that can perform tasks requiring human intelligence, such as analyzing data, recognizing patterns, and making recommendations. Many companies now use AI-powered tools during the hiring process. These systems help employers screen resumes, identify suitable candidates, schedule interviews, and even conduct initial assessments.

AI makes recruitment faster and more efficient by reducing the time required to review hundreds of applications. However, job seekers must understand how these systems work and prepare their resumes accordingly.

Understanding Digital Footprints

A digital footprint is the record of information we leave behind while using the internet. It includes our LinkedIn profile, GitHub projects, online portfolios, social media accounts, blog posts, comments, and other online activities. Everything we share online contributes to our digital identity.

A positive digital footprint can increase a person's chances of getting hired, while an unprofessional online presence may negatively affect employment opportunities. This is why students and professionals should always think carefully before posting content online.

How AI is Changing Recruitment

Many organizations use AI-powered Applicant Tracking Systems (ATS) to scan resumes before they reach a recruiter. These systems search for relevant keywords, technical skills, qualifications, and work experience related to the job description. Candidates who optimize their resumes with accurate information and relevant skills have a better chance of being shortlisted.

AI is also used to analyze interview responses, match candidates with suitable job roles, and recommend training opportunities. Although AI improves efficiency, human judgment is still important in making final hiring decisions.

Building a Positive Digital Footprint

Creating a professional online presence has become increasingly important. Some effective ways to build a positive digital footprint include:

- Maintaining an updated LinkedIn profile with accurate information.
- Creating a GitHub portfolio to showcase programming and software development projects.
- Sharing certificates, achievements, and completed internships.
- Participating in online courses and professional communities.
- Posting meaningful and respectful content instead of inappropriate or offensive material.
- Protecting personal information and maintaining online privacy.

These habits help employers recognize a candidate's skills, professionalism, and willingness to learn.

Challenges and Ethical Considerations

While AI offers many benefits, it also presents certain challenges. AI systems may sometimes make inaccurate recommendations if they are trained on incomplete or biased data. Some

qualified candidates may also be rejected because their resumes are not optimized for Applicant Tracking Systems.

Privacy is another important concern. Since employers often review candidates' online presence, individuals should be aware of what information they share publicly. Responsible use of AI and ethical handling of personal data are essential for maintaining fairness in the recruitment process.

My Personal Perspective

As a Software Engineering student, I believe AI will continue to transform the future of employment. Instead of fearing these changes, students should prepare themselves by learning modern technologies and building strong digital profiles.

I have realized that maintaining an updated LinkedIn profile, showcasing projects on GitHub, participating in internships, and continuously learning new skills can create a strong professional image. I also understand the importance of using AI responsibly as a learning tool while ensuring that my work reflects my own understanding and abilities.

This topic has encouraged me to become more mindful of my online activities because every post, project, and achievement contributes to my digital reputation. I believe that building a positive digital footprint today will create better career opportunities in the future.

Conclusion

Artificial Intelligence and digital footprints are becoming essential parts of modern recruitment. AI helps organizations identify suitable candidates more efficiently, while a person's online presence provides additional insight into their skills, achievements, and professionalism. Therefore, students and professionals should focus on developing technical skills, maintaining ethical online behavior, and building a strong digital identity. By combining continuous learning with responsible use of technology, individuals can improve their career prospects and prepare themselves for the changing world of work.
